Using the Laws of Exponents to Interpret Scientific Notation – A Co-Teaching Lesson Plan

Co-Teaching Approaches
A “(Y)” in front of the following list items indicates the approach is outlined in the lesson. An “(N)” in front of the following list items indicates the approach is not outlined in the lesson.

- (Y) Parallel Teaching
- (Y) Team Teaching
- (Y) Station Teaching
- (Y) One Teach/One Observe
- (Y) Alternative Teaching
- (Y) One Teach/One Assist

Subject
Scientific notation

Strand
Expressions and Operations

Topic
Working with scientific notation

SOL
A.2 The student will perform operations on polynomials, including
a) applying the laws of exponents to perform operations on expressions.
(Related: A.1)

Outcomes
Students will apply the laws of exponents to interpret scientific notation.

Materials
- Frame Diagram (attached)
- Frame Diagram (sample, attached)
- Scientifically Speaking activity sheet (attached)
Vocabulary

*base, exponent, power, scientific notation*

Co-Teacher Actions

<td><strong>Anticipatory Set</strong></td>
<td>Team Teaching</td>
<td>GE uses the Frame Diagram to review prior knowledge (exponent rules). This review may be set up as a cut and paste activity where the students are provided with a blank frame and each individual component. Once students have had time to cut and paste, teachers will facilitate a discussion about the exponent rules and the frame.</td>
<td>SE same as GE.</td>
</tr>
<tr>
<td><strong>Lesson Activities/Procedures</strong></td>
<td>One teach/One assist</td>
<td>GE monitors student progress. <strong>Question</strong> The mass of the sun is $1.98 \times 10^{30}$ kg. Why do you think this is written in scientific notation? GE monitors students and asks leading questions during the discussion.</td>
<td>Students will evaluate a number written in scientific notation. (5.43x10^5) SE changes the exponent to a negative number and students evaluate the new number. (5.43x10^-5) SE asks students to explain what changes. SE monitors student progress and asks leading questions during the discussion. <strong>Question</strong> The distance from the sun to Earth is 1.5x10^8 km. The distance from Earth to Jupiter is 5.95x10^8 km. How far is...</td>

**Specially Designed Instruction**
- The teacher will use the framing routine to help organize the concepts for the students. This routine has the potential to assist students who are struggling because, as a review of prior knowledge, it allows students to revisit previous ideas and concepts.

**Accommodations**
- Read through the problems with students. Have them highlight important information and discuss which operations to use.
- Allow students to use calculators to compute answers if they need support.

**Modifications**
- For students requiring a modified curriculum, content can be focused on Scientific Notation or Writing numbers in exponential notation.

**Notes**
- “Special educator” as noted in this lesson plan might be an EL teacher, speech pathologist, or other specialist co-teaching with a general educator.
- The co-teachers who developed this lesson plan received required professional development in the use of specialized instructional techniques which combine an explicit instructional routine with the co-construction of a visual device (graphic organizer). The Framing Routine in conjunction with “The Frame” helps to develop understanding of information and procedures by associating their main ideas and details. These Content Enhancement Routines were developed at the Center for Research on Learning at the
• Other graphic organizers should be used by teachers who have not received professional development in the *Framing Routine*. If Virginia teachers would like to learn the Content Enhancement Routines, contact your regional TTAC.

*Note: The following pages are intended for classroom use for students as a visual aid to learning.*

Multiply exponents

Main Idea
Zero power

Essential Details
Always equals 1

So What? (What’s important to understand about this?)

The correct method to apply exponent rules to simplify expressions.
Set up the following word problems, and apply the laws of exponents to perform the indicated operations on the expression. Show your work.

1. The mass of one molecule of water is $2.99 \times 10^{-23}$ g. If a cylinder contains $2.93 \times 10^8$ molecules of water, what is the mass of the water in the container?

2. A drop of water has an approximate mass of $5 \times 10^{-2}$ g. Given the mass of one molecule of water is $2.99 \times 10^{-23}$ g, how many molecules are in one drop of water?

3. There are 3 atoms in each molecule of water. How many atoms are in one drop of water?

4. The average distance from the sun to the Earth is $1.49 \times 10^8$ km. The speed of light is $3 \times 10^5$ km/s. How long does it take for light from the sun to reach the Earth?
5. The average distance from the sun to Neptune is 4.5043x10^9 km. How long does it take for the light from the sun to reach Neptune?

6. The populations of the United States, Canada, and Mexico are approximately 3.07x10^8, 3.33x10^7, and 1.06x10^8 respectively. What is the combined population of these three countries?
