

## Rich Mathematical Task – Grade 4 – *Camping Combinations*

Task Overview/Description/Purpose:	
<ul style="list-style-type: none"> <li>In this task, students will identify equivalent measures of liquid volume units to determine possible combinations for packing drinking water.</li> <li>The purpose of this task is for students to apply the given equivalent measure of one unit of liquid volume to determine at least two different combinations of containers totaling three gallons.</li> </ul>	
Standards Alignment: Strand – <i>Number and Number Sense</i>	
<p><b>Primary SOL:</b> 4.8d The student will solve practical problems that involve length, weight/mass, and liquid volume in U.S. Customary units.</p> <p><b>Related SOL:</b> 3.7b, 4.8c, 5.9b</p>	
Learning Intention(s):	
<ul style="list-style-type: none"> <li><b>Content</b> - I am learning to apply relationships of equivalent measures of liquid volume.</li> <li><b>Language</b> - I am learning to use language that describes different combinations of liquid volume equivalent to three gallons.</li> <li><b>Social</b> - I am learning to listen and respond to my peers' explanations in ways that move us all forward as math learners.</li> </ul>	
Success Criteria (Evidence of Student Learning):	
<ul style="list-style-type: none"> <li>I can identify equivalent measures of liquid volume, given the equivalent measure of one unit.</li> <li>I can explain the relationship of equivalent measures of liquid volume to reason about different drinking water combinations.</li> <li>I can communicate my combinations for solving using liquid volume language: equivalent, cups, pints, quarts, gallons.</li> <li>I can determine at least two different combinations of drinking water and justify my reasoning to my peers.</li> <li>I can give specific feedback and use suggestions to clarify thinking.</li> </ul>	
Mathematics Process Goals	
Problem Solving	<ul style="list-style-type: none"> <li>Students will determine equivalent measures of liquid volume to create at least two different combinations of packing drinking water.</li> <li>Students will accurately apply the relationship of one unit of equivalent measure to obtain at least two valid combinations.</li> </ul>
Communication and Reasoning	<ul style="list-style-type: none"> <li>Students will communicate their thinking process for determining two different combinations of packing drinking water to their learning community.</li> <li>Students will justify solution process in an organized and coherent matter.</li> <li>Students will use appropriate mathematical language, including equivalent to, cup, pint, quart, and gallon to express ideas with accuracy and precision.</li> </ul>
Connections and Representations	<ul style="list-style-type: none"> <li>Students will use an appropriate representation to explore the problem and justify their solution.</li> <li>Students will describe connections between their representations and the representations of their peers.</li> <li>Students will connect and/or extend thinking to other mathematical ideas such as equivalent measures of length and weight/mass.</li> </ul>

## Rich Mathematical Task – Grade 4 – *Camping Combinations*

Task Pre-Planning	
<b>Approximate Length/Time Frame:</b> 60 minutes	
<b>Grouping of Students:</b> Groups can consist of 2 to 4 students. Teacher should look for opportunities for students to be math leaders and choose student groups that encourage collaboration and perseverance.	
<b>Materials and Technology:</b> <ul style="list-style-type: none"><li>• <a href="#">Virtual Implementation Google Slides</a></li><li>• liquid volume measuring tools for 1 cup, 1 pint, 1 quart, 1 gallon</li><li>• water</li><li>• copy of task</li><li>• pencil</li></ul>	<b>Vocabulary:</b> <ul style="list-style-type: none"><li>• liquid volume</li><li>• equivalent</li><li>• cup</li><li>• pint</li><li>• quart</li><li>• gallon</li></ul>
<b>Anticipate Responses:</b> See the Planning for Mathematical Discourse Chart (columns 1-3).	
Task Implementation (Before) 10 – 15 minutes	
<b>Task Launch:</b> <ul style="list-style-type: none"><li>• The teacher will display the liquid volume measuring tools of 1 cup, 1 pint, 1 quart and 1 gallon and ask students what they already know about these tools. The teacher will record information shared by students on chart paper (or in virtual <a href="#">presentation</a>) and display during task.</li><li>• Some important ideas to listen for to support context of problem are:<ul style="list-style-type: none"><li>○ Recognizing units that are less than or greater than another unit</li><li>○ Identifying equivalent measures of liquid volume</li></ul></li><li>• Next, students will engage in a Would You Rather routine. To stimulate reasoning, the teacher will ask students to make a choice between two different scenarios and justify their thinking. The teacher will ask, “Would you rather”:<ul style="list-style-type: none"><li>○ Have 2 cups or 2 pints of chocolate milk?</li><li>○ Have 1 gallon or 4 quarts of lemonade?</li><li>○ Have 6 pints or 10 cups of soda?</li></ul></li><li>• The teacher will have a few students share their choice for each and justify their reasoning.</li><li>• The teacher will read the task aloud to students alongside the Learning Intentions and Success Criteria. Be sure to review expectations for collaborative work before dismissing into groups. Support materials and manipulatives should be accessible for student use.</li><li>• The teacher will ask questions to make sure the task is understood: “What are we trying to figure out?” “What do you already know that can help you get started?” Allow students to turn and talk.</li></ul>	
Task Implementation (During) 20 – 30 minutes	
<b>Directions for Supporting Implementation of the Task</b> <ul style="list-style-type: none"><li>• Monitor – The teacher will observe students as they work on task and ask assessing or advancing questions as necessary (see <i>Planning for Mathematical Discourse Chart</i>).</li><li>• Select – Teacher will decide which strategies will be highlighted (after student task implementation) that will advance mathematical ideas and support student learning.</li><li>• Sequence – The teacher decide the order in which student ideas will be highlighted (after student task implementation). One suggestion is to look for one common misconception and two correct responses using different strategies to share.</li><li>• Connect – The teacher will consider ways to facilitate connections between different student representations.</li></ul>	

## Rich Mathematical Task – Grade 4 – *Camping Combinations*

### Task Implementation (During) 20 – 30 minutes

- As teacher is monitoring, teacher will look strategies that are being used and record on *Planning for Mathematical Discourse Chart*.
- Teacher should use questions to assess or advance student thinking.
- Students should be encouraged to explore different strategies for solving and evaluate effectiveness.

### Suggestions for Additional Student Support

May include, among others:

- Sentence frames for supporting student-to-student discourse:
  - I agree/disagree with \_\_\_\_\_'s strategy because \_\_\_\_\_.
  - I know that \_\_\_\_ cups/pints/quarts is equal to 1 gallon. Therefore, I know that \_\_\_\_\_ cups/pints/quarts is equal to 3 gallons.
  - First I am going to \_\_\_\_\_. Next I will \_\_\_\_\_. I will know I have solved the problem because \_\_\_\_\_.
- One equivalent unit of measure for liquid volume
- Liquid volume measuring tools and water to act out problem

### Task Implementation (After) 20 minutes

#### Connecting Student Responses (From Anticipating Student Response Chart) and Closure of the Task:

- Based on the actual student responses, sequence and select particular students to present their mathematical work during class discussion. Some possible big mathematical ideas to highlight could include:
  - a common misconception;
  - trajectory of sophistication in student ideas (i.e. concrete to abstract)
  - different solutions with reasoning
  - different representation of same solution
- Connect student responses and connect the responses to the key mathematical ideas to bring closure to the task. Possible questions to connect student strategies:
  - How are these strategies alike? How are they different?
  - How do these connect to our Learning Intentions?
  - Why is this important?
- Consider ways to ensure that each student will have an equitable opportunity to share his/her thinking during task discussion, such as a gallery walk to allow feedback on all strategies.
- Close the lesson by returning to success criteria. Have students reflect on their progress related to the criteria.

#### Teacher Reflection About Student Learning:

- Teacher will use the *Planning for Mathematical Discourse Chart* (anticipated student solutions) to monitor which students are using specific strategies. This will include: possible misconceptions, learning trajectories and sophistication of student ideas, and multiple solution pathways. Next steps based on this information could include:
  - Informing sequence of tasks. What will come next in instruction to further student thinking in determining equivalent measures of liquid volume?
  - Informing small groups based on misconceptions that are not addressed in sharing.
- After task implementation, the teacher will use the Rich Mathematical Task Rubric criteria to assess where students are in their mathematical understanding and use of the process goals. This could be a focus on one category. Next steps, based on this information, could include informing small groups based on where students are in engagement in the process goal(s).

Name \_\_\_\_\_

Date \_\_\_\_\_

### Camping Combinations

The Jones family is going camping. They need to bring 3 gallons of drinking water and have the following water containers:

- (6) one quart containers
- (20) one pint containers
- (40) one cup containers

Show at least two different combinations for packing 3 gallons of water.

Choose which combination is best for packing drinking water.

Explain your thinking using pictures, numbers and words.
